

Analysis of Variance (ANOVA) 53

Assumptions in ANOVA

- ① Normality of sample Distribution of mean

The distribution of sample mean is normally distributed.

- ② Absence of outliers

Outlier score need to be remove from the data set

- ③ Homogeneity of variance

Population variance in different levels of each independent variable are equal.

$$[\sigma_1^2 = \sigma_2^2 = \sigma_3^2]$$

- ④ samples are independent and random
