

DBSCAN Clustering

- → core point
 - ⊙ → border point
 - ⊕ → outlier
- Linear clustering

minpts = 4
 ϵ = radius

In this diagram, $\text{minpts} = 4$. Point A and the other red points are core points, because the area surrounding these points in an ϵ radius contain at least 4 points (including the point itself). Because they are all reachable from one another, they form a single cluster. Points B and C are not core points, but are reachable from A (via other core points) and thus belong to the cluster as well. Point N is a noise that is neither a core point nor directly-reachable.

core point

$\text{minpts} \geq 4$

① No. of points within the ϵ should be greater ≥ 4

Border point

no. of points within this radius will be less than minpts.

outlier (Noise)
