

Bento ML

BentoML Documentation

BentoML is Unified Inference Platform for deploying and scaling AI systems with any model, on any cloud.

Steps

1. Create environment

↳ `python -m venv venv`

2. Activate it

↳ `venv\scripts\Activate.ps1`

3. Make a file

↳ `requirements.txt`

↓

↳ `bentoml == 1.4.39`

↳ `scikit-learn`

4. Install it

↳ `pip install -r requirements.txt`

5. Make a file which contain model code

↳ `train.py`

↓

About the model and dataset

6. For run this

→ python train.py

by default save in "c" drive

7. It will create the model and save it in local model store also give the tag like

Model saved: Model(tag="iris-clf: to it 3dwaegtif brd")

8. If you want to check all the model then run

→ bentoml models list

9. Make file for test the model

→ test.py

↓
it will fetch the latest model save to local and predict the output

10. Run it to get out

→ python test.py

11. create a service.py which is responsible for creating the entire api along with this it is super-super important because it create the "swagger ui" and there the decorator is responsible for creating api

12. For run service.py

↳ `bentoml serve service.py:svc --reload`

- * `svc` → it denote which service i have to run
- * `--reload` → it will reload the page any number of time based on the changes.

13. After run this you will the api and when open it you will see the entire your "swagger.ui"

14. Also with the url you can check your api through "postman".

15. Now for Bento package make a file "bentofile.yaml" and then run

↳ `bentoml build`

16. From

↳ `bentoml list`

you can check your all bentos.
