

DVC :- Data Version Control

DVC Documentation

DVC is tool for data science that takes advantage of existing software engineering toolset. It helps machine learning teams manage large dataset, make project reproducible, and collaborate better.

Steps:

1. Create Venv in folder first

↳ `conda create -p venv python==3.9 -y`

2. Activate Venv

↳ `conda activate venv /`

3. Create requirements.txt and here write

↳ `dvc`

then install it

↳ `pip install -r requirements.txt`

↳ `pip install dvc`

4. Create a "data" folder

↳ here put your data

5. Initialize dvc init

↳ dvc init

6. Commit the new files

↳ git commit -m "dvc init"

7. Add data to "dvc"

↳ dvc add data/data.txt

8. Now you can see your "data.txt" is being tracked by "dvc".

9. Now "data.txt.dvc" will track the file

10. And now git will track your "data\data.txt.dvc" or "data\gitignore" file.

↳ git add data\data.txt.dvc

↳ git add data\gitignore

11. Run "git log" from this you can check the version

12. Now run ↳ git checkout "3cf2e be" as per version

13. Now run ↳ dvc checkout

you can see you will reach on that version.

That will help you to go to previous version.
If you come back again to the latest version simply type

14. $\rightarrow$ git checkout master

15. $\rightarrow$ dvc checkout

Notes Before doing all this
Please initialize your git - init

$\rightarrow$ git init

Alternative :

Making venv from powershell

create virtual environment

$\rightarrow$ python -m venv venv

Activate virtual environment

.\venv\scripts\Activate.ps1
