Word Embedding [Wikipedia]

In natural language processing (NLP), word embedding is a term used for the representation of words for text analysis, typically in the form of real-valued vector that encodes the meaning of the word such that the words that are closer in the vector space are expected to be similar in meaning.

PCA

word → vector
sentence → vector

Word Embedding

ANN

- Count or Frequency
  - ① OHE
  - ② BOW
  - ③ TF-IDF
- Deep learning Trained Model
  - ↓
  - Word2Vec
    - CBOW [Continuous BAG OF WORDS]
    - Skipgrams

Note:

In Count or Frequency these are some limitation and those limitation will overcome by Deep learning Trained model.
