

# K Mean Vs Hierarchical Clustering

## Scalability And Flexibility

① Dataset size  $\rightarrow$  Huge  $\rightarrow$  K Means  
Small  $\rightarrow$  Hierarchical clustering

② K Mean  $\rightarrow$  Numerical data  
Hierarchical clustering  $\rightarrow$  variety of data  $\rightarrow$   $\left\{ \begin{array}{l} * \\ * \end{array} \right\} \rightarrow$  cosine similarity

③ Centroids  $\rightarrow$  Centroid  
Elbow method  $\rightarrow$  No. of centroids  
 $\rightarrow$  No. of clusters

Note: \* If only the numerical data we use K Mean as well as data is huge.

\* If data is not huge and it contains variety of data then we use Hierarchical clustering.
